

Device security reinvented, for a better future

Devicie automates end-user device security and management so your people can do their best work safely and productively.

Harnessing the power of automation, Devicie ensures all employee devices are secure, compliant and optimised with a cloud-native solution that minimises human intervention and liberates IT teams from manual configuration.

Our cloud-native platform delivers a modern workplace as a service across all your end user Windows, macOS, iOS and Android devices, wherever they are located.

Positive user experience

Devicie is designed to maximise end-user device uptime and work unobtrusively in the background. With Devicie, employees can be onboarded painlessly, anywhere in the world, and work where they want, on their device of choice. Meanwhile, your IT team knows security is locked down and can focus their efforts on more innovative tasks.

Superior operational efficiency

Devicie automates end-user device security where it makes sense, liberating your team from manual IT efforts. All provisioning, packaging and patching of devices, operating systems and applications, takes place automatically through the platform. Devicie also automates Microsoft Intune configuration and upgrades while providing your team complete visibility and control via the dashboard.

Uncompromising device security

Devicie automatically deploys security in line with best practice frameworks, including CIS, ASD E8, PCI DSS and ISO27001. Devicie continually reviews the security posture of all end-user devices, looking for configuration drift, non-compliance and potential security exposures. The platform then auto-heals and re-applies security settings while maintaining a complete audit trail.

Intune and Device are an outstanding security combo

Microsoft Intune is the foundation on which Device is built, and Intune allows Device to deliver a mix of security and productivity in a way that has not been possible before.

Device's solution:

- ✓ Configures, customises and automates the deployment of Intune across your fleet of end-user devices.
- ✓ Leverages Intune to natively deliver and manage best practice security across your device fleet.
- ✓ Device fully automates Intune and integrates with Azure Active Directory (AAD).

Onboarding Device is fast and painless

What makes Device so unique is that it delivers a powerful modern workplace as a service. The platform is completely cloud-native and leverages automation to ensure uncompromising security, ongoing compliance and complete visibility and control.

Onboarding Device takes place in a matter of hours. This includes your operating system, applications, management policies and Intune configuration. Prior to organisation roll out, we run a two-week production validation with your pilot group to ensure everything is running as it should. This requires minimal IT effort at your end.

Device is then ready to be rolled out across your organisation, so your people can do their best work safely and productively.

We're committed to making end-user device security a seamless journey for your organisation. Talk to us today for a one-on-one consult and demo of Device.

ABOUT DEVICE

Device automates an uncompromising level of end-user device security for organisations, and does this in a way that provides a radically better enablement and management experience for end users and IT teams. We have solved the security versus productivity dilemma for end-user devices, with a cloud-native solution that delivers a modern workplace as a service.
